

# Eclipse<sup>+</sup><sup>®</sup>

## Consider Your Options.

*Low profile, strain-relieved lead wires plug easily into the side to stay out of the way.*

*Battery replacement light signals time to replace the battery.*

*Lightweight, compact design ensures comfortable use. The Eclipse<sup>+</sup> is easily concealed.*

For many years, the basic TENS device has been an ideal way to relieve pain.

The Eclipse<sup>+</sup> was researched and developed from clinical input, and backed with Empi's extensive experience, to maximize pain relief for your patients. Eclipse<sup>+</sup> is the easy-to-use TENS device that offers you and your patients more options for controlling pain.

Important features of the Eclipse<sup>+</sup> include: its SD mode setting (Strength Duration modulation), making it possible for more patients to experience relief from pain. And advanced circuitry — extending the battery life — ensuring that the pain control continues, long after most other TENS devices stop.

### YOUR PATIENTS CAN TAKE COMFORT FROM THIS.

With more settings to choose from, patients can now fine-tune pain control to their individual levels. Yet Eclipse<sup>+</sup> remains easy to understand, operate and wear.

*Dual channel intensity knobs are inset and protected on top to help prevent unintentional amplitude changes.*

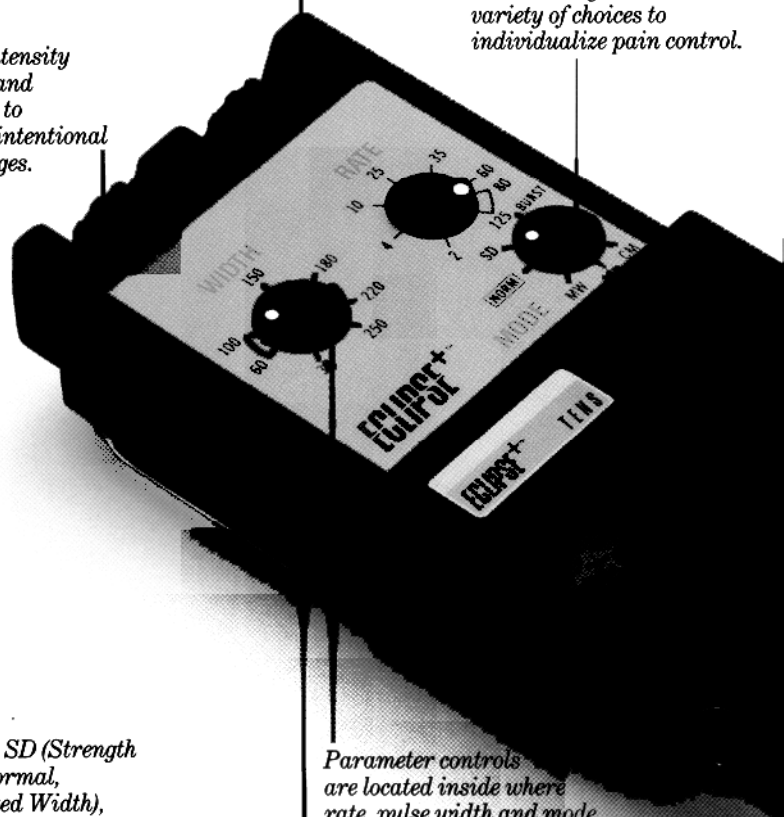

Eclipse<sup>+</sup> also offers a variety of smooth, ramped modulations. These modulations vary the combinations of rate, pulse width and amplitude to deliver comfortable, gentle stimulation.

### PRODUCTS THAT WORK — FOR YOUR PATIENT'S SAKE.

Quality will never be compromised. That's why the Eclipse<sup>+</sup> has been drop tested and 100% inspected to ensure optimal performance even under demanding conditions. The Eclipse<sup>+</sup> stimulator is covered by a lifetime warranty on parts and a two-year warranty on labor.

Eclipse<sup>+</sup> is supported by a full range of supplies and accessories that have been specifically designed to provide maximum benefit from TENS. Empi offers a variety of lead wires, electrodes, tape patches, gel, interface pads, battery packs, and chargers. Each is manufactured to provide excellent performance and reliability.

*Six modes\* give a variety of choices to individualize pain control.*

*\*Modes: Burst, SD (Strength Duration), Normal, MW (Modulated Width), MR (Modulated Rate) and CM (Combination Modulation).*

*Parameter controls are located inside where rate, pulse width and mode can be selected.*
